

M4 Responsive Layout Evaluation

Defect Log and Verification Record

This record reports the nine QA observations, the reproduction decision for each one, and the revision verification based on the screenshots and browser testing completed.

No.	Viewpor t	Page / section	Observed QA symptom	Status	Evaluation / revision
1	320px	Home navigation	Links wrapped onto multiple lines.	Reproduced	Actual defect. Spacing was reduced and wrapping was prevented; retested at 320px, 768px, and 1440px.
2	320px	About sections	Sections appeared narrow and text used several lines.	Not reproduced	Readable with no overlap or overflow. No revision.
3	480px	Contact form	Fields and message area used almost the full content width.	Reproduced	Present but usable and inside the page. Accepted; no revision.
4	600px	Skills table	Table filled most of the content section.	Reproduced	Readable without horizontal scrolling. Accepted; no revision.
5	768px	About sections	Sections were wider but content stayed concentrated in the middle.	Reproduced	Readable and usable. Accepted; no revision.
6	768px	Skills table	Table was wider than surrounding text sections.	Reproduced	Readable with no overflow. Accepted; no revision.
7	1024px	Home page	Empty space was visible below the short page content.	Partially reproduced	Empty space was below content/footer, while the Home page had main content. No responsive defect confirmed.
8	1440px	About and Contact	Wide empty spaces appeared on both sides of the content.	Reproduced	Centered content remained readable and usable. Accepted; no revision.
9	1440px	Pages with footers	Footer was reportedly separated from short content by a large gap.	Not reproduced	Footer followed content directly. Empty background was below the footer, not between content and footer.

Confirmed Revision: 320px Navigation

Hypothesis: The navigation links moved to a second line at 320px because the available screen width was not enough to fit all four links in one row.

Revision: Mobile navigation spacing was reduced and the links were prevented from wrapping.

Verification: After the revision, the navigation stayed in one row at 320px, 768px, and 1440px. No horizontal overflow was observed in the retest screenshots.

Breakpoint Decision

The original stylesheet used a max-width: 600px media query. Testing did not show a specific layout problem that began at 600px. The navigation, table, and contact form remained usable at that width. The first clear navigation problem appeared at 320px, where the links wrapped onto a second line.

Conclusion: The 600px breakpoint lacks direct observable support from the recorded tests. Future breakpoint decisions should be based on the first width where content becomes difficult to use rather than on a commonly chosen screen width. Nearby widths such as 576px, 599px, 600px, and 640px were not tested individually and are not presented as measured results.

Evidence Inventory

- Before and after 320px navigation screenshots
- After-fix Home page screenshots at 768px and 1440px
- Final breakpoint challenge screenshot showing the evidence-based conclusion
- AI QA report containing nine responsive-layout observations

Prepared for the responsive layout assessment. Final decisions remain the student's responsibility and should be reviewed against the actual project files before submission.
